SOFTWARE ENGINEER | PRIVACY & INFORMATION INTEGRITY

Sønderborg, Denmark | dnestreanschiimaxim780@gmail.com | +45 71422842

SUMMARY

Software Engineering student at the University of Southern Denmark and part-time engineer at 2ai in Sønderborg. In June 2026 my team was a finalist at the Council of Europe Democracy Hackathon in Strasbourg with a tool that lets organisations study hate speech data without exposing the people inside it. I build AI systems that have to hold up under that kind of constraint, and I care more about what they refuse to do than what they can do.

SELECTED WORK

AgnoSpeech, Council of Europe Democracy Hackathon

Strasbourg, June 2026

Finalist, one of four teams recognised out of 20, with 71 participants from 16 countries, at the Palais de l'Europe. Hate speech detectors read raw text, which hands them a shortcut: dialect and writing style predict harm well enough that the model starts using who wrote something instead of what it says. The same text also fingerprints its author. AgnoSpeech takes the identity out and leaves the evidence in, then runs an attacker against its own output to show how much identity signal is left. It all happens on a laptop CPU, with no cloud call and no raw text off the machine. I owned the backend pipeline and the deployed workbench. Team ALL FOR ONE, Moldova.

Tom, an internal AI agent with a physical body

An agent whose memory lives in a git repository, so anything it believes is a diff a person can read and revert. It reaches people through chat, a dashboard or a small desk robot, and its tools unlock by role.

Entity discovery from open public sources

A service that reads company websites and public registries and turns them into structured records. It is benchmarked on how often it picks the right company instead of a namesake, which is where this kind of tool usually breaks.

PROFESSIONAL EXPERIENCE

Software Engineer (Part-time)

2ai | April 2026 – Present

- Build and run production AI systems: Next.js interfaces, Python and NestJS services, Docker deployments.
- Design agent tooling and MCP integrations, plus the evaluation runs that catch a bad answer before a user sees it.

Backend Developer (Intern)

AI-Fusion StartUp | June 2024 - Nov 2024

- Wrote and maintained backend services in C# and ASP.NET, including the API endpoints and the data access layer under them.
- Designed database schemas in MSSQL and wrote the queries against them, using Entity Framework for persistence and for the migrations that came with each schema change.
- Worked in an agile team and learned how a change gets from code review to a server.

EDUCATION

BACHELOR OF SCIENCE IN SOFTWARE ENGINEERING, SDU

Sep 2025 – May 2028

SKILLS & LANGUAGES

- **AI Engineering:** LLM agents, MCP servers, tool design, evaluation harnesses, on-device models
- **Engineering:** Python, TypeScript, Next.js, NestJS, C#, PostgreSQL, Docker, Linux, Git
- **Languages:** Romanian (native), Russian (native), English (C1, IELTS 8.0)
- **Certifications:** Certiport IT Specialist (Device Configuration, Databases, Python, 2024)
